

$$V_- - V_{out} = \mathcal{I}_1 R_2$$

Unknowns:(5)

Solving for Yout

Vout =
$$\frac{R_4}{R_3 + R_4} \left(\frac{1 + R_2}{R_1} \right) V_2 - \frac{R_2}{R_1} V_1 = 1$$

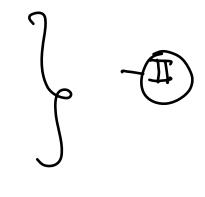

$$V_2 - V_1 = V_d$$

 $V_2 + V_1 = 2V_{cm}$

$$=) V_1 = \frac{2V_{cm} - V_d}{2}$$

$$V_2 = 2V_{cm} + V_d$$

$$V_z = 2V_{cm} + V_d$$

Vout =
$$\left(\frac{R_4}{R_3 + R_4}\right)\left(\frac{1+R_2}{R_1}\right)\left(\frac{2V_{lm}+V_d}{2}\right) - \frac{R_2}{R_1}\left(\frac{2V_{cm}-V_d}{2}\right)$$

Simplifying, we get

$$\frac{V_2 - V_1}{V_0 + R_2} = 0.5 \left[\frac{R_4}{R_3 + R_4} \left(\frac{1 + R_2}{R_1} \right) + \frac{R_2}{R_1} \right] + \frac{R_2}{R_1}$$

$$= \left[\frac{(R_4)}{(R_3 + R_4)} \left(\frac{1 + R_2}{R_1} \right) - \frac{R_2}{R_1} \right] + \frac{V_0 + V_2}{R_1}$$

$$V_{\text{out}} = \frac{R_2}{R_1} V_d = \frac{R_2}{R_1} (V_2 - V_1)$$

Since this is based on perfect matching of resistors $R_1 = R_2$ & $R_2 = R_4$ this circuit is sensitive to this matching. If the resistance changes with time (e.g. resistance increases as the resistor is healed), this circuit will not be useful to compute the difference.

Hence, this is not used for computing the difference.

An instrumentation amplifier is used to compute the difference.

(7) Instrumentation amplifier

Vout =
$$\frac{R_S}{R_J}$$
 $\frac{(R_3+R_4)}{(R_3+R_5)}$ $\frac{V_4}{R_3}$ $\frac{R_9}{R_3}$ $\frac{V_3}{R_3}$

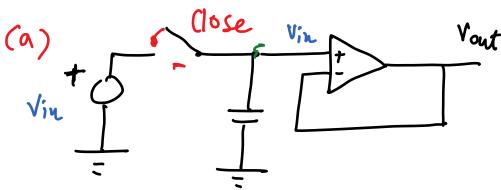

& some other equations

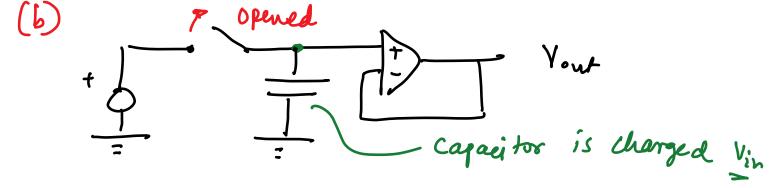

$$V_{\text{out}} = \left[\frac{R_4}{R_2} \left(1 + \frac{2R_2}{R_1}\right)\right] \left(V_2 - V_1\right)$$

Advantages over difference amp:

1) Only resistor to be watched 2) R5 was a potentioneter

(a) Switch closed
$$V_{+} = V_{in}$$
 $V_{in} = V_{out}$

$$V_{-} = V_{out}$$
